EUT. J. Biochem. 171:571-575(1988).

-I-FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR
PROTEINS BY POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR

-I-FROME BY POLY (ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR
ON DNA AND IS INVOLVED IN THE REGULATION OF VAROUS IMPORTANT
CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND
THUMOR TRANSPORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR
EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-I-CATALYTIC ACTIVITY: NAD(+) + {ADP-D-LIBOSY1}(N)-acceptor =
nicotinamide + {ADP-D-TiDOSY1}(N+1)-acceptor.

-I-COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.

-I-SUBCELLULAR LOCATION: Nuclear.

-I-SUBCELLULAR LOCATION: Nuclear.

-I-SUBCELLULAR LOCATION: Nuclear.

-I-SUBCELLULAR ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OF THE ENZYME ITSELF, AND
FURTHER ADP-RIBOSYL GROUP ON A HISTONE OF THE ENZYME ITSELF, AND
FURTHER ADP-RIBOSYL GROUP ON A HISTONE OF THE Z'-POSITION OF
THE TERMINAL ADENOSINE MOLETY, BUILDING UP A POLYMER WITH AN
AVERAGE CHAIN LENGTH OF 20-30 UNITS.

-I-SIMILARITY: BELONGS TO THE PARP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This SWISS-PROT entry is copyright.  This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation. the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).
 -:- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor -
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-:- SUBCELLULAR LOCATION: NUCLEAR (By similarity).
-:- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; may be produced by alternative splicing.
-:- TISSUE SPECIFICITY: WIDELY EXPRESSED. THE HIGHEST LEVELS ARE IN THE BRAIN, HEART, PANCREAS, SKELETAL MUSCLE AND TESTIS; ALSO DETECTED IN KIDNEY, LIVER, LUNG, PLACEMYA, OVARY AND SPLEEN; LEVELS ARE LOW IN LEUKOCYTES, COLON, SMALL INTESTINE, PROSTATE AND
 TISSUE-Fibroblast;

 VWFA.
INTERACTION WITH THE MAJOR VAULT PROTEIN.
 -1- SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE NUCLEUS. ASSOCIATED WITH MITOTIC SPINDLES.
-1- TISSUE SPECIFICITY: WIDELY EXPRESSED; THE HIGHEST LEVELS ARE IN THE KIDNEY; ALSO DEFECTED IN HEART, PLACENTA, LUNG, LIVER, SKELETAL MUSCLE, SPLEEN, LEUKOCYTES AND PANCREAS.
-1- SIMILARITY: BELONGS TO THE PARP FAMILY.
-1- SIMILARITY: CONTAINS 1 BRCT DOMAIN.
 NUCLEAR LOCALIZATION SIGNAL 2ND PART

 polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_ZCX_ZMHX_ZC (I). The nucleic acid sequences motif, of general formula CX_ZCX_ZMHX_ZC (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.

This invention describes novel human and murine poly(ADP-ribose) polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_2CX_2NHX_2C (I). The nucleic acid detection of PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying pARP effectors or binding partners, as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from call death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the murine PARPI protein used in the method of the invention.

 This invention describes novel human and murine poly(ADP-ribose)
polymerase (PARP) homologues, which are characterised by an amino acid
sequence with a functional NAD⁺-binding site and no zinc finger
sequence motif, of general formula CX_2CX_ZMHX_2C (I). The nucleic acid
sequences, PARP homologues and antibodies are useful for analytic
detection of PARP homologues and for identifying PARP effectors or
binding partners, as well as for determining their effectiveness.
PARP-binding partners are useful for the diagnosis or therapy of a
disease condition, which is the result of a PARP protein, especially an
energy deficiency, which may comprise tissue damage from cell death
following necrosis or apoptosis. The disease condition may be chosen
from a neurodegenerative lilhess, or sepsis or ischemic tissue damage,
in particular neurotoxic disturbances, etc. This sequence represents the
human PARP3 protein used in the method of the invention.

 polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD^+-binding site and no zinc finger sequence woith a functional NAD^+-binding site and no zinc finger sequence motif, of general formula CX_ZXAMX_ZQ (I). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotoxic disturbances, etc. This sequence represents the human PARP3 protein used in the method of the invention.

 The present sequence represents the NAP protein of Zea mays. This protein is a poly(ADP-ribose) polymerase (PARP) protein (also known as poly(ADP-ribose) transferase). The PARP enzyme is involved in programmed cell death or apoptosis, and is a nuclear enzyme. The NAP polymucleotide sequences can be used for modulation of programmed cell death in plants, to induce, or protect against, programmed cell death, depending on the extent to which PARP activity is reduced. Reducing expression of endogenous NAP class PARP only is also used to modulate programmed cell death, to increase growth rate and to produce plant cells that are more tolerant of stress (cold, chemical treatments, pathogens, pests, drought, heat, etc., or during transformation). Particular applications are generation of plants that are resistant to fungl or nematodes; are male or female sterile, or have better seed-shatter properties. The methods are also used to increase growth of transformed plant cells (and derived calli or

 contg. a DNA-binding domain (DBD). It is encoded by AAT13732, from which a fragment comprising nucleotides 67-1220 (-29 to + 1127) encoding the DBD can be inserted into vectors which are used for gene therapy. Over-expression of the DBD inhibits the DNA repair function of PARP, so the vectors are useful for gene therapy or tumours, esp. in combination with conventional chemo- and/or radiotherapy.

This is the human poly (ADP-ribose) polymerase protein (PARP) sequence.

PARP is a 116kD DNA-binding protein that binds tightly to single-strand double-strand breaks. The PARP protein and Escherichia coli UvrA and double-strand stars at least one modification of the method for the detection and quantitation of DNA base damage. The method for the detection and quantitation of DNA base damage. The method involves quantifying at least one modification of interest in a nucleic acid sequence through the used of capillary electrophoresis, laser induced fluorescence and a fluorescently labeled polypeptide (e.g. fluorescently labeled polypeptide (e.g. fluorescently specific for the modification. The new method is useful for quantifying nucleic acid modifications, especially a mutation (including deletions, insertions and substitutions), mismatch, DNA adduct, or strand break (single or double). The method is useful for identifying and detecting exposure to carcinogens, and in early risk assessment for cancer, and is

 The present invention provides the protein and coding sequence for human tankyrase2 protein. This is found in two different versions, designated TANK2-LONG and TANK2-SHORT. Tankyrase2 has polyADP-ribosylation activity and is involved in the modification of TRFI, which is a telomere-specific binding protein. The regulation telomore length, in which TRFI has a role, is linked to againg and cancer. The sequences are useful in the treatment of cancers and inflammatory disorders.

 This invention describes a novel vector (A), suitable for gene therapy, which contains a DNA insert (I) that encodes a practically complete colly(adenosine diphosphate-ribose) polymerase (PARP) which has antitumor activity. PARP is a nuclear DNA repair enzyme (activated by strand breakage), that allows recovery of proliferating cells from the toxic effects of DNA damage (caused by alkylating or oxidizing agents or radiation), and protects cells against such damage or other causes of genomic instability. (A) are used for treatment of cancer and for cancer prevention in subjects at high risk (e.g. those with tumor-associated genetic defects). Tumor cells treated with (A) show an increased tendency to die when treaded with radiation or chemotherapeutic agent, and in cells that survive this treatment they inhibit genomic instability, so should reduce the likelihood of further development of both malignant cells and resistance to chemotherapy. This sequence

Novel genes and proteins, antibodies and binding partners useful in diagnosis and therapy of energy deficiency associated disease conditions

Claim 4; Page 52-54; 96pp; German.

17;

polymerase (PARP) homologues, which are characterised by an amino acid sequence with a functional NAD++binding site and no zinc finger sequence motif, of general formula CX\_2XZAMKZC (I). The nucleic acid sequences, PARP homologues and antibodies are useful for analytic detection of PARP homologues and for identifying PARP effectors or binding partners as well as for determining their effectiveness. PARP-binding partners are useful for the diagnosis or therapy of a disease condition, which is the result of a PARP protein, especially an energy deficiency, which may comprise tissue damage from cell death following necrosis or apoptosis. The disease condition may be chosen from a neurodegenerative illness, or sepsis or ischemic tissue damage, in particular neurotaxic disturbances, etc. This sequence represents the human PARP2 protein used in the method of the invention. This invention describes novel human and murine poly(ADP-ribose)

Ë

WPI; 2001-032983/05 N-PSDB; AAC82090 Drugs for inhibiting PARP or especially homologous enzymes comprising 4-substituted phthalazinone derivatives, useful e.g. for treating neurodegenerative disease, ischemic damage, tumors or diabetes

Example A; Page 12-13; 14pp; German.

This invention describes novel 4-substituted 2H-phthalazin-1-one derivatives (I) which are used for the treatment or prophylaxis of diseases associated with elevated poly (ADP-ribose)-polymerase (PARP; EZ 2.4.2.30) activity. The products of the invention have nootropic, neuroprotective, cerebroprotective, antiparkinsonian, nephrotropic, cardiant, vasotropic, antionovulsant, cytostatic, antibacterial, immunosuppressive, antinflammatory, antirheumatic, antibacterial, antidabetic. (I) are especially used for treating or preventing neurodegenerative disease or neuronal damage (specifically associated with ischemia, trauma or massive bleeding, especially apoplexy or spinal-cranial trauma or massive bleeding, especially apoplexy or spinal-cranial trauma or massive bleeding ischemic damage (specifically renal damage after renal ischemic or during and after (specifically renal damage after renal ischemia), treating epilepsy, specifically generalized epileptic attacks (e.g. temporal lope tonic-clonic attacks) or partial epileptic attacks (e.g. temporal lope and complex partial attacks), treating microinfarction (e.g. during and

Search completed: August 29, 2002, 07:57:21 Job time: 298 sec

```
17;
 transplantation), revescularization of critically constricted coronary arteries (e.g. after PCTA or by-pass operations) or peripheral arteries (e.g. leg arteries), treating acute myocardial ischemia and damage during or after its mechanical or dury induced lysis and treating tumors and their metastasis, sepsis and septic shock, inflammatory and rheumatic disease (e.g. rheumatoid arthritis), and diabetes mellitus. Although (I) inhibit PARP (i.e. the known form designated PARPI), they especially selectively and strongly inhibit PARP homologs, specifically the homolog PARP2. In particular (I) have very strong PARP2 inhibitory activity (e.g. with K.i values of 1-20 nM) and high selectivity for PARP2 relative to PARPI (generally by a factor of more than 5).

 NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).
 Ansorge W. Wirkner U., Mewes H.-W., Gassenhuber J., Wiemann S.; Submitted (MAY-1999) to the BMBL/Gabmark/DBB databases.
-!- CATALVITC ACTIVITY: NAD+ + + {ADP-D-ribosy](N)-acceptor - nicotinamide + {ADP-D-ribosy]}(N+1)-acceptor.
-!- SUBCELDULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Widely expressed; the highest levels are in the kidney, skeletal muscle, liver, heart and spleen; also detected in pancreas, lung, placenta, brain, leukocytes, colon, small intestine, ovary, testis, prostate and thymus.
-!- SIMILARITY: BELONGS TO THE PARP FAMILY.
 PPO3_HUMAN STANDARD; PRT; 533 AA.

 17;
CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN (BY
 SIMILARITY).
SUBUNIT: HOMODIMER (POCENTIAL).
SUBCELLULAR LOCATION: Nuclear.
MISCELLULAR LOCATION: Nuclear.
MISCELLULAR LOCATION: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO
AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE BYZME ITSELF, AND
FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF
THE TERMINAL ADENOSINE MOIETY, BUILDING UP A POLYMER WITH AN
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN.

-!-SUBUNIT: HOMODIMER (POTENTIAL).
-!-SUBUNIT: HOMODIMER (POTENTIAL).
-!-SUBCELLULAR LOCATION: Nuclear.
-!-SUBCELLULAR LOCATION: Nuclear.
-!-MISCELLANGOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FUTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOISINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
-!-SIMILARITY: BELONGS TO THE PARP FAMILY.
-!-SIMILARITY: CONTAINS I BRCT DOMAIN.
 Biochemistry 36:12147-12154(1997).

-!- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY[ADP-RIBOSYL]ATION. THE MODIFICATION IS DEPENDENT ON DAM AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR
 domain reveals amino acids involved in polymer branching.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               MOL. BIOL. 278:57-65(1998).

-I- FUNCTION: POLY[ADP-RIBOSE] POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY (ADP-RIBOSE) POLYMERASE MODIFIES VARIOUS NUCLEAR PROTEINS BY POLY (ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TOWNS TRANSPORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-I- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor—nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor—nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor—nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor—NSCELLULAR (FOCHALIAL).

-I- SUBCELLULAR (POCHATION: Nuclear.

-I- SUBCELLULAR LOCATION: Nuclear.

-I- MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND THE TEMHNAL ADBROSINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.

-I- SIMILARITY: BELONGS TO THE PARP FAMILY.

-I- SIMILARITY: BELONGS TO THE PARP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. DOMAIN

DEVELOPMENTAL STAGE: EXPRESSED BOTH MATERNALLY AND ZYGOTICALLY IN EMBRYOS, PUPAE AND ADULTS. EXPRESSION IS HIGHEST IN EMBRYOS.
MISCELLANGOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELE, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENGSINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
SIMILARITY: BELONGS TO THE PARP FAMILY.
SIMILARITY: CONTAINS I BRCT DOMAIN. nicotinamide + [ADP-D-Tibosyl] (NH1)-acceptor.
-!- COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: EXPRESSED IN ADULT FEMALE OCCYTES, ANAL PLATES
OF STAGE 12 EMBRYOS AND IN CELLS AROUND THE CENTRAL NERVOUS SYSTEM IN LATER EMBRYOS.

NUCLEAR LOCALIZATION SIGNAL 1ST PART
                                                                                                                                                                                               PROTEINS OF 193 AND 240-kDA.
SUBCELLULAR LOCATION: CYTOPLASMIC, BUT IS ALSO FOUND IN THE
NUCLEUS, ASSOCIATED WITH MITOTIC SPINDLES.
TISSUE SPECIFICITY: WIELLY EXPRESSED; THE HIGHEST LEVELS ARE IN
THE KIDNEY; ALSO DETECTED IN HEART, PLACENTA, LUNG, LIVER,
SKELETAL MUSCLE, SPLEEN, LEUKOCYTES AND PANCREAS.
"The nuclear protein PHSP of the inter-alpha-inhibitor superfamily: missing link between poly(ADP-ribose)polymerase and the inter-alpha-inhibitor family and a novel actor of DNA repair?";
                                         inter-alpha-inhibitor family and a novel actor of DNA repair?";
FEBS Lett. 446:6-8(1999).
-!- CATALTYIC ACTUITY: NDC|+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!- SUBUNIT: BINDS TO THE MAJOR VAULT PROTEIN (MPV). THE VAULT, A LARGE RIBONUCLEOPROTEIN COMPLEX, CONTAINS THE 100-KDA MPV AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NUCLEAR LOCALIZATION SIGNAL 2ND PART

A; Residues: 658-685, 689-696, 893-901 <TA2>
C; Superfamily: NAD+ ADP-ribosyltransferase
C; Keywords: DNA binding: glycosyltransferase; NAD; nucleotide binding; nucleus; P-loo
F; 21-51/Region: zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NAD+ ADP-ribosyltransferase (EC 2.4.2.30) - bovine NAD+ ADP-ribosyltransferase (EC 2.4.2.30) - bovine N;Alternate names: ADP-ribosyltransferase (polymerizing); poly(adenosine diphosphate C;Species: Bos primiganius taurus (cattle) C;Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 19-Jan-2001 C;Accession: JS0428; S00328; A30458 R;Salto, I. submitted to JIPID, February 1990

                                                                                                                                                                                                                                                                                                                                                                                                                     NAP- ADP-ribosyltransferase (EC 2.4.2.30) - flesh fly (Sarcophaga peregrina)
N.Alternate names: poly(ADP-ribose) polymerase
C; Species: Sarcophaga Peregrina
C; Date: 10-Sep-1999 #sequence_revision 10-Sep-1999 #text_change 16-Jun-2000
C; Accession: $42208; $71496
R; Masultani, M.; Nozaki, T; Hitomi, Y.; Ikejima, M.; Nagasaki, K.; de Prati, A.C.; Kurat Eur. J Biochem. 220, 607-614, 1994
A; Title: Cloning and functional expression of poly(ADP-ribose) polymerase cDNA from Sarch A; Reference number: $42208; MUID:94170813
A; Molecule type: mRNA
A; Residues: 1-996 <AMS>
A; Accession: $71496
A; Molecule type: protein
A; Residues: 170-188; 721-736; 813-819; 879-885 <AMX>
C; Superfamily: Nab+ ADP-ribosyltransferase
C; Keywords: DNA binding; glycosyltransferase: NAD; pentosyltransferase; zinc finger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Molecule type: protein

Residues: 170-188;721-736;813-819;879-885 <MAX>

Superfamily: NAD+ ADP-ribosyltransferase

Keywords: DNA binding; glycosyltransferase; NAD; pentosyltransferase; zinc finger

17-369/Domain: DNA binding #status predicted <DNA>

1370-507/Domain: auto-modification #status predicted <AMO>
